OpenClaw Masterclass

The Definitive Guide to Autonomous Orchestration

1. The Philosophy of Zero Overhead

> *"If you're still copy-pasting into a chat box, you're working for the AI." - Nat & Matthew Principles*

The Masterclass is built on the premise that agents should live where you work: the terminal, the filesystem, and the web. No browser tabs, no manual intervention.

2. Log Harvesting & Command Capture

Orchestration requires a trail. Use these commands to maintain your agent's memory:

```
 # Stage your changes
git add .

# Commit with intent
git commit -m "feat: implement autonomous loop"

# Push to the cloud
gh pr create --title "Deploy Masterclass" --body "Automated PR from s
```

```
# Generate documentation
pandoc guide.md -o guide.pdf --pdf-engine=weasyprint
```

3. Orchestration Logic

The Master Orchestrator delegates deep work to specialized agents. In March 2026, we've seen a surge in M4 Mac Mini demand specifically for these agentic workloads.

```
# Spawn a Scout for market analysis
subagents spawn "Analyze Mac Mini shortage trends" --label scout-run

# Run a QA Loop
subagents spawn "Audit masterclass-guide.pdf against Nat & Matthew pr

# Enable Headless Mode for all Browser Actions
# ensure --headless is passed to puppeteer/playwright scripts
python3 scripts/toggle_headless.py --mode on
```

4. High-Fidelity Deployment

Automate your Vercel deployments to keep your dashboard live:

```
# Deploy to Vercel
vercel --prod --confirm
```

```
# Update your dashboard with the latest guide
python3 scripts/update_dashboard.py --file masterclass-guide.pdf
```
